DBI

DBI's large particle size sandblasting is called CRISTALSTEPS. It gives glass a good non-slip surface. Combined with an acid treatment, it protects against dirt deposits and improves non-slip properties of treated surfaces.

Description

CRISTALSTEPS combines sandblasting and acid treatment to create a surface that is less slippery in comparison to a simple sandblasting treatment, with anti-dirt properties.

Use

CRISTALSTEPS is made to be used on floor tiles and stair steps in homes, offices, hotels and restaurants, businesses...

Treatment is applied directly to laminated floor tiles

Advantages

Personalization

CRISTALSTEPS can be completely personalized:

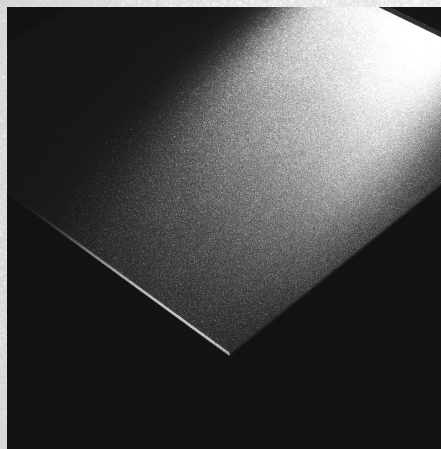

- plain treatment;
- alternating transparent and translucent effects;
- making logos, designs and patterns of your choice.

Easy maintenance

CRISTALSTEPS is dirt-resistant and very easy to clean and maintain.

Does not alter with time

An acid treatment applied to sandblasted etching permanently changes the characteristics of sandblasting, making CRISTALSTEPS more dirt-resistant.

Dimensions and thicknesses

There is no limit on maximum dimension or thickness for shaped work.

Transformation

After treatment, glass can be cut, shaped, tempered, laminated (satin side should not be in contact with PVB).

Range

CRISTALSTEPS treatments are only made-to-measure.

Single shade treatment

CRISTALSTEPS can be applied to all or part of the surface. In this case, a text, logo, geometric design or other pattern can be added.

Glass media

CRISTALSTEPS can be applied to most glass media, shaped or not, however, the final application is best on laminated glass.
